

Notion card structure for Nursery

What the app reads and writes when you import via "Add → From Notion"

In Notion this is a **database** where **one row (page) = one app**. Property and file names matter — Nursery looks them up by exact names (keys inside text fields are case-insensitive).

● Setup

- 1 Create an integration at `notion.so/my-integrations` and copy its token (`ntn_...`).
- 2 Connect the integration to the database: **•••** → Connections → your integration.
- 3 Paste the token into Nursery: **Settings → Notion**.
- 4 In Nursery: **Add → From Notion** and paste the page link.

● Card properties

NAME (EXACT)	TYPE	PURPOSE
App Name	Title	the app name (required)
App Number	Number	series number (optional)
Service Data	Text	technical fields as Key: value lines (see below)
Metadata	Text	App Store texts as Key: value lines (see below)
Privacy Policy	URL	privacy policy link
Account Email	Email	Nursery fills this in after sign-in

Service Data format (multi-line text):

```
Bundle: com.example.app
App ID: 6779139953
Team ID: 2TYSW9U536
Issuer ID: 59695608-b2b8-445f-b806-665df2...
```

Metadata format (multi-line text):

```
Short Description: short description
Full Description: full app description...
Keywords: word1,word2,word3
Subtitle: subtitle
```

● Attached files

Files go as blocks on the page or in a *Files* property. Nursery recognizes them by name:

- **source.zip** — project source (Xcode / Flutter) for building the IPA
- **iphone69.zip**, **iphone67.zip**, **iphone65.zip** — iPhone screenshots (6.9" / 6.7" / 6.5")
- **ipad13.zip**, **ipad129.zip** — iPad screenshots (13" / 12.9")
- **AuthKey_XXXXXXXXXX.p8** — App Store Connect API key (optional — Nursery can create it itself)

Files in Notion are optional. **Screenshots and source can also be added manually** right in Nursery: drag a .zip or a folder onto the Screenshots and Build tabs. Notion is convenient when everything lives there, but it is not the only way.

● What Nursery writes into the card itself

- **cert.zip** — certificates and keys after they are created
- **Service Data** — after creating the app and certificates in ASC, Nursery writes **App ID, Team ID, Issuer ID** here, plus **Bundle ID** if it was empty (generated from the name)
- **Account Email** — the Apple account email after sign-in

Nursery is an App Store publishing pipeline. This document describes the minimal required structure; the app ignores any other fields in your Notion database.
